

WHAT IS CLAIMED IS:

1. A life-and-death monitoring method of monitoring, by any of a plurality of host computers connected to a common network, a life-or-death state of other host computer, comprising the steps of:

5 a step of transmitting a life-and-death monitoring packet including a table having a management order of a host computer to be managed, and an address and a check flag of said host computer from a management host computer to any of said host computers to be managed;

10 a step, by said host computer to be managed which has received said life-and-death monitoring packet, of checking a check flag of said table in which the address of said host computer is registered; and

15 a step, by said host computer to be managed which has completed said checking, of transmitting said life-and-death monitoring packet to a subsequent host computer to be managed according to said management order of said table.

20 2. The life-and-death monitoring method as set forth in claim 1, wherein

5 when said host computer to be managed which have completed said checking and will transmit said life-and-death monitoring packet to a subsequent host computer to

10043170-011402

be managed according to said management order recognizes in advance that said host computer to be managed which comes next in the management order is incommunicable, said life-and-death monitoring packet is transmitted to a further subsequently registered communicable host computer to be managed without sending the packet to the incommunicable host computer to be managed in question.

3. The life-and-death monitoring method as set forth in claim 2, wherein

when there exist a plurality of said host computers to be managed which are recognized as incommunicable, said life-and-death monitoring packet is transmitted to said host computer to be managed which comes further subsequently in the order to the plurality of incommunicable host computers to be managed in question.

4. The life-and-death monitoring method as set forth in claim 1, wherein

at the end of the management order of said table in said life-and-death monitoring packet, an address of said management host computer is registered, so that said life-and-death monitoring packet which has been transmitted in said management order is lastly transmitted to said management host computer.

5. The life-and-death monitoring method as set forth in claim 1, wherein

said management host computer having received said life-and-death monitoring packet generates said life-and-death monitoring packet including said table targeted at said host computer to be managed whose check flag of said table is not checked and transmits said packet to said host computer to be managed whose flag is not checked.

6. The life-and-death monitoring method according to claim 1, wherein

when said life-and-death monitoring packet is not returned to said management host computer, a new life-and-death monitoring packet is generated by changing the management order of said table in said life-and-death monitoring packet and transmitted.

7. A life-and-death monitoring system at a plurality of host computers connected to a common network, comprising:

a host computer to be managed and a management host computer for checking a life-or-death state of the host computer to be managed in question, wherein

said management host computer transmits a life-and-death monitoring packet including a table having a management order of said host computer to be managed,

5

10 and an address and a check flag of said host computer to
any of said host computers to be managed, and

15 said host computer to be managed which has
received said life-and-death monitoring packet checks a
check flag of said table in which the address of said
host computer is registered and said host computer to be
managed which has completed said checking transmits said
life-and-death monitoring packet to a subsequent host
computer to be managed according to said management
order of said table.

20 8. The life-and-death monitoring system as set forth
in claim 7, wherein

5 when said host computer to be managed which have
completed said checking and will transmit said life-and-
death monitoring packet to a subsequent host computer to
be managed according to said management order recognizes
in advance that said host computer to be managed which
comes next in the management order is incommunicable,
said life-and-death monitoring packet is transmitted to
10 a further subsequently registered communicable host
computer to be managed without sending the packet to the
incommunicable host computer to be managed in question.

9. The life-and-death monitoring system as set forth
in claim 8, wherein

when there exist a plurality of said host

10043170-01402

computers to be managed which are recognized as
incommunicable, said life-and-death monitoring packet is
transmitted to said host computer to be managed which
comes further subsequently in the order to the plurality
of incommunicable host computers to be managed in
question.

10

10. The life-and-death monitoring system as set forth
in claim 7, wherein

at the end of the management order of said table
in said life-and-death monitoring packet, an address of
said management host computer is registered, so that
said life-and-death monitoring packet which has been
transmitted in said management order is lastly
transmitted to said management host computer.

5

11. The life-and-death monitoring system as set forth
in claim 7, wherein

said management host computer having received
said life-and-death monitoring packet generates said
life-and-death monitoring packet including said table
targeted at said host computer to be managed whose check
flag of said table is not checked and transmits said
packet to said host computer to be managed whose flag is
not checked.

10

12. The life-and-death monitoring system as set forth

10043170.011402

in claim 7, wherein

when said life-and-death monitoring packet is not returned to said management host computer, said management host computer generates a new life-and-death monitoring packet by changing the management order of said table in said life-and-death monitoring packet and transmits the generated packet.

13. A life-and-death monitoring computer program for use in monitoring, by any of a plurality of host computers connected to a common network, a life-or-death state of other host computer, comprising the functions of:

transmitting a life-and-death monitoring packet including a table having a management order of a host computer to be managed, and an address and a check flag of said host computer from a management host computer to any of said host computers to be managed,

at said host computer to be managed which has received said life-and-death monitoring packet, checking a check flag of said table in which the address of said host computer is registered, and

at said host computer to be managed which has completed said checking, transmitting said life-and-death monitoring packet to a subsequent host computer to be managed according to said management order of said table.

1004370-01403

20

14. The life-and-death monitoring computer program as set forth in claim 13, further comprising the function of,

5 when said host computer to be managed which have completed said checking and will transmit said life-and-death monitoring packet to a subsequent host computer to be managed according to said management order recognizes in advance that said host computer to be managed which comes next in the management order is incommunicable, transmitting said life-and-death monitoring packet to a
10 further subsequently registered communicable host computer to be managed without sending the packet to the incommunicable host computer to be managed in question.

15. The life-and-death monitoring computer program as set forth in claim 14, further comprising the function of,

5 when there exist a plurality of said host computers to be managed which are recognized as incommunicable, transmitting said life-and-death monitoring packet to said host computer to be managed which comes further subsequently in the order to the plurality of incommunicable host computers to be managed
10 in question.

16. The life-and-death monitoring computer program as

10043170"04EE00T

set forth in claim 13, wherein

said management host computer having received
said life-and-death monitoring packet has the function
of generating said life-and-death monitoring packet
including said table targeted at said host computer to
be managed whose check flag of said table is not checked
and transmitting said packet to said host computer to be
managed whose flag is not checked.

17. The life-and-death monitoring computer program as
set forth in claim 13, further comprising the function
of,

when said life-and-death monitoring packet is not
returned to said management host computer, generating a
new life-and-death monitoring packet by changing the
management order of said table in said life-and-death
monitoring packet and transmitting the generated packet.
